Assignment 2 – Basic HTML Site

Description:
This assignment taught me how to code a drop down, input boxes, make hyperlinks to other portions of code in different files in HTML, and that the index.html file is what will be the default starting point.

Approach / What I Did:
In order to complete the assignment, I had to first figure out all the syntax for the things necessary such as the bits and the drop down box code. I did this by looking up the idea of what they were on w3schools. So basically looking up "drop down box w3schools" etc. I also had to figure out how to use VS Code, because I just edited the file in a notepad for the last assignment. VS Code was pretty straight forward, the hardest part was figuring out how to open a terminal. The trick to opening a terminal was utilizing my eyes to find the Terminal button at the top.

Issues and Resolutions:
Write about issues you encountered while working this assignment and how you resolved them. One issue I had was changing the index.html file's name to home.html. The server317.js file wasn't able to find where it should start, so when I tried to load the page it would start off with an error since it didn't have anything to load. The way I fixed it was looking at the server317.js file and setting up the route for the home page. I then changed it back after figuring out that I could just rename the home.html file back to index.html.

Analysis:
I've learned how to make a webpage with multiple sections that can be navigated through. I think that one thing that could impact users is obviously the layout and look of the website, as well as how fast it loads. The look of a website has a large impact on whether a user would return or continue to use the site. The speed at which the website loads would impact how fast the user gets their desired information.
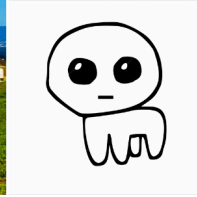

Screen shots:
Provide several screenshots of steps you have taken while working on this assignment.
